Ateneo de Davao University, Roxas Ave, Poblacion District, Davao City, 8000 Davao del Sur

AI TOOL OVERVIEW

I. Name of AI Tool

   A. Chat GPT

II. Purpose/Domain

   A. To ask about information related to my course which is Psychology.

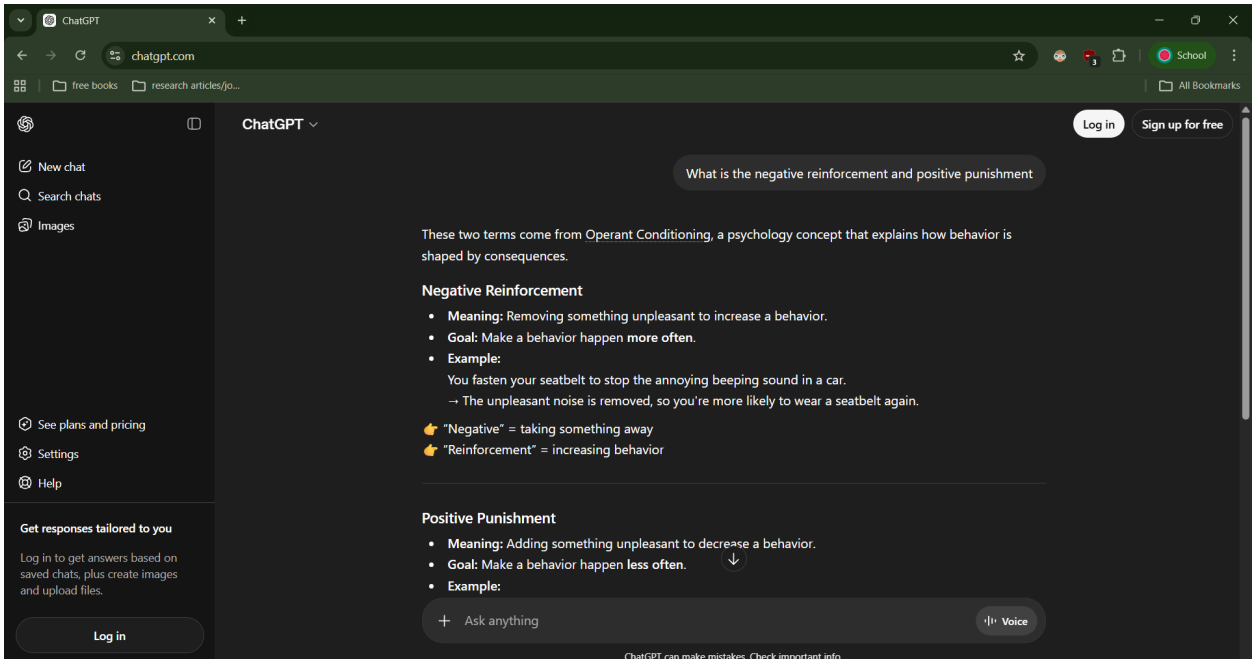
III. Why I choose it

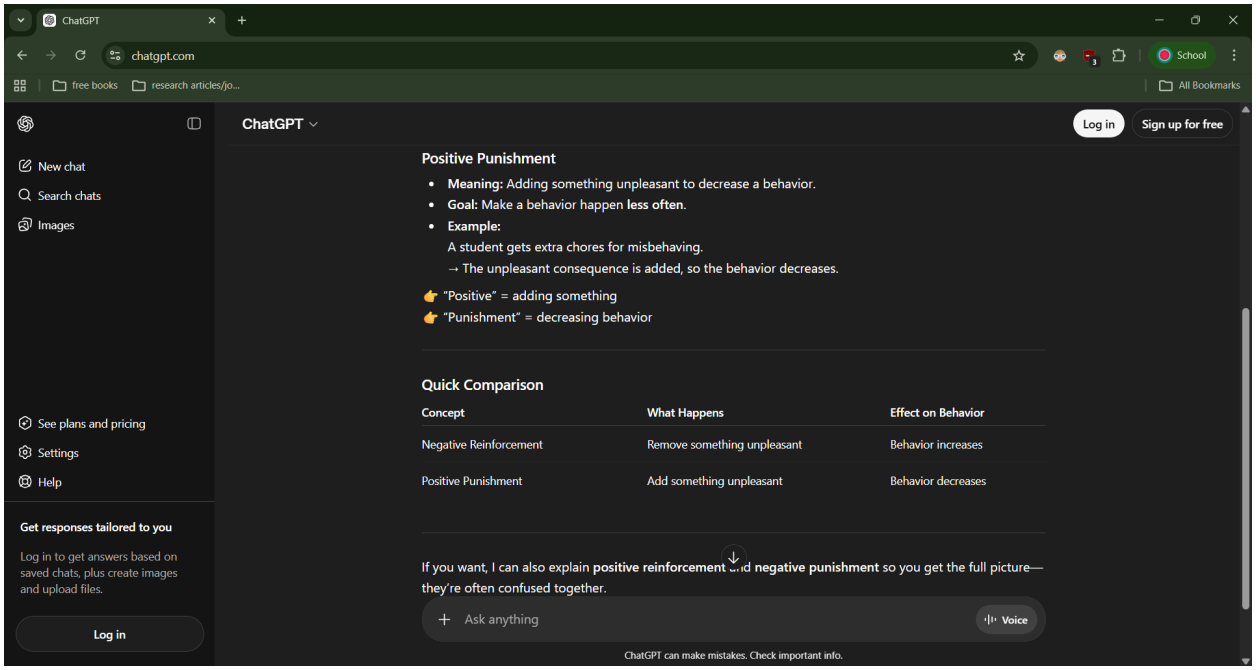
   A. The LLM has amassed amounts of information and is widely used, therefore, it is theoretically more informed among the LLM's.

ORIGINAL PROMPT AND OUTPUT

The following is the original or initial prompt done on Chat GPT:

I. "What is the negative reinforcement and positive punishment"





AI-ASSISTED PROMPT AND OUTPUT

The following is the improved prompt done on Chat GPT:

I. "explain the terms 'negative reinforcement' and positive punishment' from the psychological context, more specifically Operant Conditioning"

Examples:

- Taking painkillers to get rid of a headache → you're more likely to take them again when in pain
- Doing chores to stop a parent from nagging → increases likelihood of doing chores
- Pressing snooze to stop an alarm sound (short-term increase in snoozing behavior)

Important note:
Negative reinforcement is **not punishment**—it actually **encourages** behavior.

🔹 Positive Punishment

Definition:
A process where a behavior is weakened because it is followed by **adding an unpleasant consequence**.

Key idea: The behavior decreases because something bad is added.

- "Positive" = addition
- "Punishment" = decreases behavior

How it works:
When a behavior leads to something uncomfortable or undesirable, the person learns to **avoid repeating that behavior**.

Examples:

- Getting scolded for talking back → reduces likelihood of talking back
- Receiving extra assignments for being late → discourages tardiness
- Touching a hot stove and feeling pain → reduces future touching

---

🔄 Core Difference

Concept	What happens to stimulus	Effect on behavior
Negative Reinforcement	Something unpleasant is **removed**	Behavior **increases**
Positive Punishment	Something unpleasant is **added**	Behavior **decreases**

🧠 Big Picture Insight

Both concepts are part of how humans and animals learn from consequences:

- Reinforcement (positive or negative) → **strengthens behavior**
- Punishment (positive or negative) → **weakens behavior**

COMPARISON AND ANALYSIS

The A.I. tool that I used was ChatGPT. The original or initial prompt I used was, "What is the negative reinforcement and positive punishment", the response I received was a quick summary of the difference between the two concepts that included: the definition meaning, the goal meaning, an example, an individual summarized meaning or definition of each word that constitute the respective concept, and a short table that differentiates the two concepts and makes them easier to understand.

Nextly, I typed in an improved prompt that stated, "explain the terms 'negative reinforcement' and positive punishment' from the psychological context, more specifically Operant Conditioning", to which I then received a more detailed explanation that included: who developed the concepts, a brief introduction from where the concepts fall under, the short definition of each concept, their key ideas, how they work, three examples each, an important note, a short table that briefly differentiates the two and sums it up, and the final brief picture insight which is basically a conclusion or review of what was presented.

With these in mind, we can see that the initial prompt gives a more summarized output while the improved prompt gives more details in the LLM's response. I'd say that the improved prompt is more accurate as it provides more details and more notes about what makes the two concepts different from one another. Overall, the improved prompt gave more information and was clearer, gave more examples which would be more insightful, and seemed to use papers on the web for the accuracy of the information (the accuracy is confirmed by me as the two concepts are learned in my course). After the original prompt, I provided more details in the question of my improved prompt which greatly affected the answer I would likewise receive. This led me to realize that how you write and structure your prompts are crucial to the responses the LLM would provide you in return.
